

Installation

👶 First Steps!

👤 Headless Setup

 Google Colab

 Docker

Requirements

For example, we may have:

👶 First Steps!

```
from ai2thor.controller import Controller
controller = Controller()
event = controller.step("MoveAhead")
```

🙈 Headless Setup

Therefore, we have been worked with Unity to enable headless (off-screen) rendering of AI2-THOR. Headless mode can be enabled by setting the `platform` to `CloudRendering` upon initialization:

```
from ai2thor.controller import Controller
from ai2thor.platform import CloudRendering
controller = Controller(platform=CloudRendering)
```

To get started with AI2-THOR, you may find it useful to use [AI2-THOR Colab](#). It enables you to run AI2-THOR on Google Cloud for free in a browser, without any setup on your local device!

By default, AI2-THOR does not work out of the box with Google Colab, as it requires the use of Xorg for AI2-THOR to work.

For users that prefer Docker, we provide [AI2-THOR Docker](#) as a mini-framework to simplify the setup.

OS	macOS 10.9+ or Ubuntu 14.04+
----	------------------------------

Python Python 3.5+

CPU SSE2 instruction set support

Graphics Card	DX9 (shader model 3.0) or DX11 with feature level 9.3 capabilities
---------------	--

Linux Users	X server with GLX module enabled
<pre> \$ cat /etc/passwd grep ^xorg xorg:xorg:/usr/share/sgml:/usr/sbin/xorg </pre>	<pre> \$ cat /etc/passwd grep ^xorg xorg:xorg:/usr/share/sgml:/usr/sbin/xorg </pre>
